The present PCR primer was used to amplify cDNA encoding a fragment containing exon 1c of a murine mu-opioid receptor (MOR-1) splice variant. The specification describes 11 new exons for the MOR-1 gene, which combine to yield 15 novel splice variants of the MOR-1 gene. These splice variants are potential targets for modulating morphine analgesia and opioid-mediated ingestive responses. The MOR-1 polypeptide is used to screen compounds for opioid activity. Such compounds are potential analgesics or more generally agents that affect gastrointestinal canalgesics or more generally agents that affect gastrointestinal motility, respiration or the immune, endocrine or autonomous nervous of systems, e.g. regulators of peristalsis. Antagonists, agonists and ligands of MOR-1, as well as DNA vectors expressing MOR-1-encoding nucleic acids, or sequences antisense to MOR-1 nucleic acids, are used to regulate morphine analgesia and body weight. The level of MOR-1 or tissue distribution of MOR-1 and measured to diagnose MOR-1 related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

AAA29067-68 are primers for amplification of the human beta-actin gene which was used as a control when amplifying the BEER gene to determine its tissue-specificity. BEER is a human transforming growth factor-beta (TGF-beta) binding protein (BEER). The HBEER gene has been localized to the chromosome 17q12-21. The CDNA and protein may be used for prevention, treatment and diagnosis of diseases associated with inappropriate BEER syression. For example, they may be used to treat disorders associated with decreased TGF-beta BP expression. The CDNA or vectors may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of BEER by expressing inactive proteins or to supplement the patients own production of BEER pertended. The nucleic acids may be used for recombinant production of BEER, gene therapy, antisense therapy, as probes for diagnostic assays and for identification of BEER modulators. BEER may be used to raise antibodies and for increase bone mineral content for the treatment of disorders such as the patients of the increase such as the patients and other disorders associated with

This sequence represents a PCR primer used in the detection of a single mucleotide polymorphism (SNP) in the human alpha4-integrin promoter nucleotide sequence defined in EMBL 126659. The invention relates to the diagnosis of SNPs in the human alpha4-integrin subunit gene, comprising determining the sequence of the gene in at least one of 5 positions within the coding region and/or 8 positions within the promoter region of the gene. Diagnosis of SNPs in the human alpha4-integrin subunit gene comprises determining the gene sequence in at least one of the following positions: (1) 740, 2273, 2446, 3311 and 3506 in the coding region of EMBL 126509) and/or (3) 184, 238, 331, 436, 676, 1010 or 1115 in the promoter region (EMBL M26641). The method is used to identify subjects of diseases, e.g. autoimmune, allergic and vascular inflammatory diseases concerned and the coding regions and to developing) alpha4-integrin subunit ligand mediated concerned to identify patients who will benefit from treatment with the salso used to identify patients who will benefit from treatment with particular alpha4-integrin subunit likely clinical responses and to determine the therapeutic dose. Nucleic acid sequences that contain at least one polymorphism are used to screen for compounds the trangeutic agents that may target selectively one or more alleles of the therapeutic agents that may target selectively one or more alleles of the therapeutic agents that may target selectively one or more alleles of the readable storage medium containing the polymorphic sequences is useful containing the polymorphic sequences is useful generally those at 2273, 3311 and 1010 which are relatively common, are useful as genetic markers in linkage studies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô

The present sequence for human TANGO 298 TagMan probe is used to measure human TANGO 298 gene expression by quantitative PCR. TANGO 298 (AAU02497) is a novel secreted protein isolated from clone jyhmal18f02 from a human bone marzow cDNA library. The gene for TANGO 298 maps to chromosome 19p13.3. TANGO 298 shows sequence homology to human adipsin (complement factor D) and may play a role in the alternative complement pathway and in regulation of systemic energy balance. TANGO 298 may be used to treat haemoglobinnial, obesity, diabetes, blood and haematopoietic associated disorders (e.g. leukaemia), monocyte associated disorders (e.g. impaired phagocytosis) cardiovascular disorders (e.g. unstable angina, atherossis), immune disorders (e.g. arthritis, AIDS), inflammatory consorders (e.g. bacterial infection), disorders associated with abnormal serine protease function (e.g. AIDS), and platelet consorders (e.g. thromosis). Human secreted protein; TANGO 298; chromosome 19p13; probe; bone marrow; nucleic acid molecule encoding type II transmembrane proteins useful complement factor D; alternative complement pathway; complement regulator deficiency; serine protease dysfunction; adipsin; obesity; diabetes; blood and haematopoietic associated disorder; cardiovascular disorder; inflammatory disorder; immune disorder; ss. disorders (e.g. thrombosis). The invention also describes the novel secreted proteins human TANGO 269 (AAU02495) and murine TANGO 269 (6-carboxyfluorescein)" Sequence 23 BP; 6 A; 13 C; 2 G; 2 T; 0 U; 0 Other; for treating immune related disorders /mod_base= OTHER /note= "OTHER=TAMRA" Example 1; Page 103; 137pp; English. The present sequence is that of human Factor V (FV) gene primer A F5(254) -23D, used in bi-directional PCR amplification of specific alleles (Bi-SpSA), used in bi-directional PCR amplification of specific alleles (Bi-SpSA). Its name indicates an A primer for FV (FS), the 5' end beginning at base 254 of the FIX gene exon 10 and proceeding downstream for 23 bases. It also has a 5' G8C2 tail. A mutation (G to A transition) at by thromboembolism. Detection of the mutation in the FV gene was used to thromboembolism. Detection of the mutation in the FV gene was used to primers (A and B) are each specific for different alleles. P is complementary to the antisense strand of both alleles in a region upstream of the sequence difference (mismatch). Q is complementary to the sense strand of both alleles in a region downstream of the complements are contained segment of size PB resulting from the 2nd allele, and a combined segment of size PB resulting from the 2nd allele, and a combined segment of size PD resulting from the 2nd allele, and a combined segment of size PD. In homosygotes, segment PC relative yield of DNA products obtained using the present primer was (B ingh, as indicated by a very strong DNA band on agarose gels. Bi-PASA provides a one-tube method for similarmeously differentiating homozygotes and heterozygotes. It can detect small deletions and insertions as well as single base changes Bi-PASA is also used to perform population. screening, haplotype analysis, patient screening and carrier testing. The method is rapid, reproducible, inexpensive, non-isotopic and amenable to automation

The invention relates to a composition comprising one or more nucleic acid molecules and at least one oligonucleotide, where at least a portion of the oligonucleotide is capable of hybridising with at least a portion of the nucleic acid molecule and where the oligonucleotide comprises a condition and molecule and where the oligonucleotide comprises a modified nucleotide at or near the 3'-terminal nucleotide. The various condition of more target nucleic acid molecules in a sample during nucleic acid cone or more target nucleic acid molecules in a sample during nucleic acid synthesis or amplification. The analogues are also useful for determining the presence or absence of one or more particular nucleotides at a specific position or positions in a target nucleic acid molecule. The capablifying one or more nucleic acid molecules, by mixing one or more nucleic acid molecules, by mixing one or more nucleic acid molecules, by mixing one or more nucleic acid incubating the mixture to synthesise or amplify one or more nucleic acid incubating the mixture to synthesise or amplify one or more nucleic acid incubating the mixture to synthesise or amplify one or more nucleic acid incubating the mixture to synthesise or amplify one or more nucleic acid incubating the mixture to synthesise or amplify one or more nucleic acid incubating the mixture to synthesise or amplify one or more nucleic acid discrimination related oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition comprising nucleic acid molecules and a oligonucleotide capable of hybridizing with a portion of nucleic acid, and comprises a modified nucleotide at or near the 3'-terminal nucleotide.

The nucleic acids may be TWAST, HOXAS, NES-1, retinoic acid receptor beta (RARbeta), costrogen receptor, cyclin D2, Wilms' tumour gene (WT-1), 13.3 sigma, HN-10 r RASSF1A. The method is useful for diagnosing and/or determining a predisposition to a cellular proliferative disorder, in particular breast cancer including ductal carcinoma in situ, lobular carcinoma, colloid carcinoma, tubular carcinoma, medullary carcinoma, metaplastic carcinoma, intraductal carcinoma mistu, lobular carcinoma in situ and cancinoma in situ. The present sequence is a primer used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

The invention relates to a method for treating pulmonary fibrosis
involving administering to a subject at risk of or suffering from
bulmonary fibrosis, an amount of an antagonist of a renin-angiotensin-
aldosterone system e.g., a caspase enzyme inhibitor or an endonuclease
inhibitor that inhibits pulmonary epithelial cell apoptosis, where the
attagonist is a non-thiol angiotensin activating enzyme (ACE) inhibitor.

The method is useful for treating a subject suffering from pulmonary
fibrosis such as idiopathic pulmonary fibrosis, sarcoidosis, familial
carbon pneumoconiosis, hypersensitivity pneumonitides, pulmonary fibrosis
carbon pneumoconiosis, hypersensitivity pneumonitides, pulmonary fibrosis
caused by inhalation of inorganic dust, pulmonary fibrosis caused by an
infectious agent, pulmonary fibrosis caused by inhalation of noxious
caused by inhalation of inorganic dust, pulmonary fibrosis caused by intreating a
interstitial lung disease (ILD). The method is also useful in treating a
cubject at risk of pulmonary fibrosis and undergoing radiation therapy or
chemotherapy and in treating pulmonary fibrosis associated with collagen-
casculated alsorders or vasculitides, histiocytosis X, Goodpasture's
syndrome, chronic essinophilic pneumonia, idiopathic pulmonary
chaemosiderosis or arrhythmia. This sequence represents a reverse
transcriptase PCR (RT-PCR) primer used in the method of the invention.
                                                                                       Treating pulmonary fibrosis by administering antagonist of reninangiotensin-aldosterone system e.g. non-thiol angiotensin activating enzyme inhibitor, caspase enzyme or endonuclease inhibitor that inhibits apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cellular proliferative disorder; breast cancer; methylation; predisposition; PCR; primer; CpG island; ss; human; retinoic acid receptor beta 2; RAR beta2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human retinoic acid receptor beta 2 (RAR beta2) primer #18.

                                                                                                                                                                                                                                                                                                                                                                             Diagnosing glaucoma in a sample comprises detecting altered expression of bone morphogenic proteins in sample from a cell or bodily fluid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is an upstream primer for the PCR amplification of the human beta-actin gene. RT-PCR was used to examine the expression of bone morphogenic protein (BMP) family genes in human trabecular meshwork and optic nerve head tissues. The invention provides methods for diagnosing glaucoma based on altered expression of BMPs. Also provided are methods for treating glaucoma and for identifying agents suitable for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              caspase enzyme inhibitor; endonuclease inhibitor;

The invention describes a method of diagnosing a cellular proliferative disorder of breast tissue in a subject comprising determining the state of methylation of one or more nucleic acid isolated from the subject, where the state of methylation of one or more nucleic acids is compared with the state of methylation of one or more nucleic acids is compared with the state of methylation of one or more nucleic acids is compared with the state of methylation of one or more nucleic acids is compared to having the cellular proliferative disorder of breast tissue. Also described are: a method for determining a predisposition to a cellular proliferative disorder of breast tissue in a subject; an ethod of diagnosing a cellular proliferative disorder of breast tissue in a subject. The method is useful for diagnosing a cellular proliferative disorder of breast tissue in a subject. The method is useful for diagnosing a cellular proliferative disorder of breast tissue in a subject. This sequence represents a primer used in the analysis of the methylation state of the twist gene CpG silands in normal mammary epithelium, breast cancer cell lines and in primary mammary tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, panoreas, panoreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   transplant rejection; immune system; rheumatoid arthritis; lupus; inflammatory bowel disease; multiple sclerosis; HIV; AIDS; ss; primer.
subject comprises determining the state of methylation of one or more nucleic acid isolated from the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to diagnosing or monitoring transplant

rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, kenotransplant rejection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinases other than cell-cycle dependent kinases CNI, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDKI, PCNA and Cyclin B1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinases other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification represents a primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacions responses to and side effects from the SEC ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3867, are not actually given a sequence in the Sequence Listing from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CBK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human biallelic marker downstream amplification primer SEQ ID NO:11527.
                                                                                                                                                                                                                                                                                                                                      restenosis, cleaves
                                                                                                                                                                                                                                                                                                                                 New hairpin and hammerhead ribozyme for inhibiting restenosis, cleave RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipaoriatic, dermatological, cytostatic, antisebornheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH$57877 to AAH$62099 represent sequences used in the

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozywe (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproleinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin gisases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keindell contracting and hypertrophic or hypertrophic burn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..
0
Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoritasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MWP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatiis; actinic keratosis; squamous cell carcinoma; seborrheic wart; vitreoretinopathy; scar;

                                                                                                                riboxyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, chermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, cophthalmological, vulnerary, keraclytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin gisases such as psoriasis, atopic dermatitis, actinic keracosis, squamous or basal cell carcinoma and viral or seborheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreorietinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
                                                                                                                                                                                                                                                                                                                                                                                  ö
                        Treating proliferative skin or eye diseases and scarring, using ribozymes
                                                                                            The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a

(1) is useful for inhibiting the expression of Cyclin D2 in cells or tissues in vitro. (1) is thus useful for treating disease associated with Cyclin D2 expression. (1) is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This sequence represents human cyclin D2 inhibition associated oligonucleotide
                                                                                                                                                                                                                                                 The invention relates to an assay for identifying a compound that modulates the activity of a gene or protein associated with rheumatoid arthritis. The method of the invention comprises providing a cell expressing a gene or protein associated with rheumatoid arthritis, contacting the cell with a test compound, and determining whether the test compound modulates the activity of the gene or protein. The method of the invention is useful for preparing a composition for treating rheumatoid arthritis. The current sequence represents a PCR primer used in the isolation of rheumatoid arthritis associated genes.
                                          arthritis-associated gene or protein by determining whether the test compound modulates the activity of the gene or protein expressed in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense inhibition of human cyclin D2 related oligonucleotide #23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cyclin D2 expression, comprises an oligonucleotide comprising up nucleobases in length, which inhibits expression of Cyclin D2 in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel antisense compound useful for treating diseases associated
Identifying a compound that modulates the activity of rheumatoid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates an isolated polynucleotide (I) encoded by a cardiovascular associated (CA) gene, having allelic variation contained in a functional surrounding like full length cDNA for CA gene polypeptide, and with or without the CA gene promoter sequence. (I) is a polynucleotide comprising single nucleotide polymorphisms predicting cardiovascular disease. The polynucleotide are useful for assessing predisposition or susceptibility to a cardiovascular disease, e.g. attherosclerosis, ischemial/reperfusion, hypertension, restenosis, arterial inflammation myocardial infarction, and stroke. These may also be used to predict personal medication schemes omitting adverse drug reactions, or as probes for detecting genetic polymorphisms and as templates for the recombinant production of normal or variant peptides/polypeptides encoded by the genes. This sequence corresponds to a PCR primer to amplify one of
                                                                                                                                                                                                                                                                                                                                               SNP; single nucleotide polymorphism; cardiovascular associated gene; allelic variation; atherosclerosis; ischemia; reperfusion; hypertension; restenosis; arterial inflammation; myocardial infarction; stroke; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotides comprising single nucleotide polymorphisms of the cardiovascular gene, useful for assessing predisposition or susceptibility to a cardiovascular disease, e.g. atherosclerosis, restenosis or stroke.

The invention describes an isolated polypeptide (I) comprising a caids as given in the specification or a region consisting of 5 or more caids as given in the specification or a region consisting of 5 or more contiguous amino acids, where the region includes amino acid of 634 of (S1). Also described are: an isolated polynuclectide (II) comprising a fully defined sequence (S2) of 2405 base pair as given in the specification, or its complement, a polynuclectide (II) comprising a complement, a polynuclectide that selectively bybridizes to (S2) relative to a known polynuclectide, or a region of 15 or more contiguous nuclectides, the region comprising nucleotide 1904 of (S2); vector, preferably an expression vector (III) comprising (II); a comprising (II); detecting (MI) differential expression of a LIPIN3 polynuclectide in a test sample; detecting obesity or obesity or obesity or a region of (V) or (VI), where the region is 10 or more celated disorders associated with differential expression of (V), or a region of (V) or (VI), where the region is 10 or more certicates in length; soreening (M2) for agents that reduce the cexpression of a LIPIN3 polynuclectides in length; soreening (M2) for agents that reduce the cexpression of a (II) in a test cell sample; antibodies that specifically, bind to (I); a recombinant cell comprising a recombinantly modified (II); and a test cell sample; antibodies that specifically, such that the (II) is overexpressed; a composition comprising two or more (II); and dentifying an alteration in a test cell sample; antibodies that specifically is useful for detecting (I) in a desity related disorder. (II) is useful for detecting (II) in a desity or an obesity related with obesity or in obesity related disorder which involves detecting (II) in (M2), the cell is an adipocyte or such that involves detecting (II) in (M2), the cell is an adipocyte or and any or an order of a primer used to identify and sincle or a primer used to identify or a column of the single or an order or an order or an or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinases conter than cell-cycle dependent kinases CDKI, PCNA and CYClin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                  New hairpin and hammerhead ribozyme for inhibiting restenosis, cleave RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 14.8; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1. PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA86745. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                               SS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

                                                                 'n
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytchine involved in inflammation, matrix metalloproteanse (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (1) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytckine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis,
Representative examples of ribozyme recognition sites are given in AAA8615 to AA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient
                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cell-cycle dependent kinase cdk6 ribozyme binding site SEQ ID NO:585.

squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretimopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for treating a proliferative skin or eye dieease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used
                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                    ö

and (II) are useful for treating proliferative skin
            diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virteoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scarr, AMH57577 to AMH62099 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding [1]. (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cell-cycle dependent kinase cdk2 ribozyme binding site SEQ ID NO:205

ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or sebornheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to short interfering nucleic acids (siNA) which

further comprise ensure and antisense regions, or alternatively are assembled from a sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the sinks include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain and contain an engage and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the cancer and other proliferative disease (e.g., restement of a variety of conditions. They may be used for treating cancer and other proliferative diseases (e.g., restement for a variety and/or allergic diseases, autoimmuno diseases, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence con the lower strand of a human IGF-IR-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human IGF-1R transcript target sequence/siNA upper strand, SEQ ID NO:77.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
downregulate expression of the human insulin-like growth factor 1 receptor (IGF-1R) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They

Can be unmodalited or comencally mountated, can context.

Can be unmodalited or comencally mountated, can context.

Cat be unmodalited or can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits

Cor the in vitro or in vivo deal very of sinA, conjugates and/or complexes

of sinA, and vectors that express sinA. The sinAs are used to modulate

expression of the IGF-IR gene in cells, tissue explants or organisms

(e.g., by ex vivo gene therapy), or in grafts and transplants for the

treatment of a variety of conditions. They may be used for treating

cancer and other proliferative diseases (e.g., restenosis and polycystic

kidney disease), inflammatory and/or allergic diseases, autoimmune

diseases and transplant rejection. The sinAs are also useful for drug

screening, diagnosis, therapeutic target identification and validation,

can apping (e.g., of single nucleotide polymorphisms). The present sequence

represents the upper strand of a human IGF-IR-targeted double-stranded

siNA, which is identical to the IGF-IR transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                     New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer , downregulates expression of the insulin-like growth
                                                                                                                                                                                                                             The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human insulin-like growth factor 1 receptor (IGF-IR) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are sssembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), doublestranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          short interfering nucleic acid; siNA; breakpoint cluster region; vabl Abelson murine leukaemia viral oncogene homologue 1; BCR-ABL; cytostatic; leukaemia; lymphoma; human; ss; siRNA; ERG2; v-ets erythroblastosis virus E26 oncogene like (avian).

                                                                                                                                                                                      The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siNNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ERG2 (v-ets erythroblastosis virus E26 oncogene like (avian))-
                                                                                                                             New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      v-abl Abelson murine leukaemia viral oncogene homologue 1; BCR-ABL; cytostatic; leukaemia; lymphoma; human; ss; siRNA; ERG2; v-ets erythroblastosis virus E26 oncogene like (avian).

The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ERG2 (yets expliciblastosis virus E26 oncogene like (avian))-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the DLG1, KIAA0783, DPF3 or CENPC1 regions which are associated with breast cancer in a nucleic acid sample from a
                                                                                                                                                                                               New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; Gene therapy; breast cancer; human; DLG1; KIAA0783; DPF3; CENPC1; SNP; single nucleotide polymorphism; PHF14; PHD finger protein 14; chromosome 7p21.3; zinc finger protein; transcription factor; extend; primer; ss.

The present invention relates to a method for identifying a subject at tisk of breast cancer. The method comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The nucleic acid sample comprises the DiG1 region (ADO79402), KIAA0783 region (ADO79403), DPF3 region (ADO79404) or CENPC1 region (ADO79405), The gene DiG1 (discs).

CC comprises the DiG1 region (ADO79405), The gene DiG1 (discs), DPF3 region (ADO79404) or CENPC1 region (ADO79405), DPF3 region (ADO79404) or CENPC1 region (ADO79405), DPF3 region (ADO79405), DPF3 region (ADO79404) or CENPC1 region (ADO79405), DPF3 region (ADO79404) or CENPC1 has been mapped to chromosomal position 7221.3. The KIAA0783 protein is a control of the region of trials. The present sequence was used in an example from the invention Sequence 19 BP; 10 A; 3 C; 4 G; 2 T; 0 U; 0 Other;

This is a forward PCR primer designed for use with a reverse primer (see AAVS2682) in the PCR amplification of exon 8 and the flanking introns (see AAVS26565 of the human hepatocyte nuclear factor-4 alpha (HNF-4 alpha) gene (see AAVS2687). Mutations of the HNF-4 alpha gene have been identified by amplifying (see AAVS2665-86) and sequencing the appropriate exon. The invention concerns the identification of genes responsible for

The present sequence represents a PCR primer for growth hormone receptor (GRR) used in an example of the present invention. The present invention describes new methods for increasing the growth rate of a human patient having partial growth hormone insensitivity syndrome (GHLS) or a non-Growth Hormone (GH)-deficient short stature but not Laron Syndrome; the patient has a height of at least -2 standard deviations (GD) below normal for age and sex, has a serum level of high-affinity GH-binding protein of at least 2 SD below normal, has serum levels of insulin-like growth at least 2 SD below normal mean levels and has a mean level or maximum stimulated serum level of GH that is at least normal, and growth rate is increased by administering an effective amount of GH and/or IGF-I. The methods are used to treat people with short stature including familial stature. The patient especially has a heterologous intra- or stature or growth growth or idiopathic short stature.
                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid encoding hepatocyte nuclear factor 1-alpha and beta - useful for detecting susceptibility for non-insulin dependent diabetes, especially maturity-onset diabetes of the young.
                                                                                                                                                                                                                                                                                                                                                     Gaps

non-insulin dependent diabetes mellitus (NIDDM) for use in diagnostics and therapeutics. It demonstrates that the MODY1 (maturity-onset diabetes of the young) locus is the HMF-4 alpha gene. Analysis of mutations in the HMF-4 alpha gene can be diagnostic for diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivits; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAZ01424) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microoraganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        primers AAZ01426-Z06209 were used to amplify open reading frames

```
This sequence represents a PCR primer that can be used in the method of the invention. The method is for genetic diagnosis using human micochondrial DNA where there is at least one base replacement from among the following five replacements: the 3010th base is changed from guanine to adenine; the 4883rd base from cytosine to thymine; the 5178th base from cytosine to thymine; the 5178th base the 14668th base from cytosine to thymine; and the 14668th base from cytosine to thymine; and diagnosing the probability of contracting adult diseases. A confirmation of base replacement can give a diagnosis of the level of probability of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Genetic diagnosis using human mitochondrial DNA - comprises detecting

This invention describes a novel composition comprising a number of sensor arrays, where each array comprises a unique probe oligonucleotide, which is the reverse complement of part of a unique target which is the reverse complement of part of a unique target coligonucleotide present in a mixture of target deletion sequence oligonucleotides. The compositions form a method for characterizing a sample of target deletion oligonucleotides which are labelled and hybridize with the probe oligonucleotides of the sensor arrays. Such oligonucleotides and their targets are represented in AAX3548*X23709. Oligonucleotides characterized by the method form pharmaceutical compositions that are useful for modulating cellular adhesion or proliferation, and being active against a eukaryotic pathogen, a human rectorive against a eukaryotic pathogen, a human cretrovirus, including influence virus (EMV), or a non-human retrovirus, including influence virus, Epstein-Barr virus, Respiratory Syncytial virus or cytomegalovirus (CMV). The compositions enable characterization of deletion sequence oligonucleotides having related, continued in uncleobase sequences, and quantification of different uncleobase sequence ("target") oligonucleotides in a mixture. Species of deletion sequence ("target") oligonucleotides in a mixture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ó
                                                                                                                                                                                                                                                                                                                                           New compositions comprising sensor arrays made up of unique probe oligonucleotides - useful for characterizing a sample of target deletion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                region;

                                                                                                                                                                                                                                                                                                                                                        PCR primers AA236935-36 were used to amplify an EcoRI/BrsG1 fragment containing 5' distron of the gag gene of Moloney murine leukemia virus (MoMLV). The amplified fragment was used to construct the retrovirus particles of the invention. All the genetic elements needed to construct these retroviral particle are incorporated into one or more recombinant adenoviruses that are defective for at least all or part of the El and B4 regions. The retroviral particles formed are defective, but infectious, and transfer nucleic acid very efficiently. The amplified products are used for in vitro or ex vivo production of retroviral particles and for preparation of a product intended for production of retroviral particles
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    modulation; signal transducer and activator of transcription;

                                                                                                                                                                                                                                                                         Producing retroviral particles from recombinant, defective adenoviruses,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                in vivo. The particles produced are used to transfer nucleic acid into cells, to create animal models of disease which are useful for studying gene regulation and bioavailability. The retroviral particles are also useful for gene therapy of neurodegeneration, tumours, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     disease, infection or many other disorders and for genetic vaccination

The sequences can be used in the treatment of cancer and retrograde diseases in the nervous system. The present sequence is a PCR primer for the
                                                                                                                                                                                                                                                                                            The present invention describes the 1,5-anhydroglucitol dehydrogenase protein (1,5-AGDH) isolated from Agrobacterium tumefaciens. The 1,5-AGDH protein is useful as a detecting reagent for early stage diabetes. The present sequence represents a PCR primer for 1,5-AGDH, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, NADH ubiquinone oxidoreductase 20KD subunit, BioNADH20; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            염
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ð
                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an antisense compound (I), 8 to 30

cucleobases in length, that is targeted to a nucleic acid molecule
cucleobases in length, that is targeted to a nucleic acid molecule
cucleobases in length, that is targeted to a nucleic acid molecule
cucleobases in length, that is targeted to a nucleic acid molecule
cucleobases or condition of STAT3 in cells or tissues, treating an animal having a disease or condition associated with STAT3 or a human
cucleobase or condition characterised by a reduction in apoptosis,
and inducing apoptosis in a cell. Diseases or conditions that are treated
and/or neck, leukaemia, myeloma, melanoma or lymphoma. (I) can also be
cused for diagnostic methods in detecting and determining the role of
styry3 in various cell functions, physiological processes and conditions
and for diagnostic the conditions associated with expression of STAT3.
(I) can be used alone or with other drugs as an immunostimulator. (I) is
used in sandwich and colourimetric assays, involving enzyme conjugation
and radiolabeling and is used in diagnostic kites AAC93150 encodes human
STAT3 and AAC93231 encodes mouse STAT3 as given in the exemplification of

The invention relates to antisense compounds targeted to a nucleic acid molecule encoding a signal transducer and activator of transcription (STAT) protein, specifically STAT3, where the antisense compounds inhibit the expression of STAT3. The antisense sequences are useful for inhibiting the expression of STAT3 in cells or tissues, inducing Fasmediated apoptosis in cells, and sensitising cells to apoptosis. They are also useful for treating an animal having a disease or condition associated with STAT3. These disorders include inflammatory or autoimmune disease, particularly rheumatoid arthritis, cancers, such as those of the breast, prostate, brain and head and neck and leukaemias, myslomas. Melanomas and lymphomas. Also treatable are human diseases or conditions characterised by a reduction in apoptosis or an insensitivity to apoptotic signals. The sequences of the invention can be used in clinical cresearch, for detecting and determining the role of STAT3 in various cell functions and physiological processes and for diagnosing conditions associated with the expression of STAT3. The sequences represent cDNA encoding human STAT3 and human STAT3 oligonucleotides
                                                                                                                                                                                                                                                                                                                                   antisense gene therapy; Fas-mediated apoptosis; inflammatory disease; utodimunue disease; themmatoid arthritis; cancer; breast; prostate; head; neck; brain; leukaemia; myeloma; melanoma; lymphoma; apoptosis; antiinflammatory; immunosuppressive; antiinflammatory; immunosuppressive; antiinflammatory;
                                                                                                                                                                                                                                                                                                                  STAT3; human; signal transducer and activator of transcription; ss; STAT;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antisense compound useful for treating and diagnosing inflammatory diseases and cancers, is targeted to a nucleic acid molecule encoding signal transducer and activator of transcription proteins.
                                                                                                                                                                                                                                                                          Human STAT3 antisense phosphorothioate oligodeoxynucleotide #26.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 14.8; DB 1; Length 20;

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker computivell plates; (b) a primer designed based on the chromosome marker complished for plates from the resultant complified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. succeed to completely in each wells of longitudinal completely in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the capellates are specified from the amplified by using the above primer; (g) signals can discrimination nos. are mixed clones are cultured and the constituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and arrayed. The correspondence of the primers for human chromosome ligits. Which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

Modulating angiogenesis and an immune response in an individual, for treating a hypoxic or ischemic condition, comprises administering a compound that modulates the activity of a signal transducer and activator of transcription 3.

Disclosure; Page 32; 94pp; English.

The invention relates to a method of modulating angiogenesis and immune response. Method involves administering to an individual a compound that modulate the activity of signal transducer and activator of transcription 3 (Stat3). Modulating angiogenesis is useful for treating or preventing, hypoxic or ischaemic condition or disorder which is the result of stroke, ischaemia, coronary atherosclerosis, myocardial infarction, inflammation, tissue ischaemia in the lower extremities, infarction, inflammation, tissue ischaemia in the lower extremities, infarction, inflammation, chronic obstructive pulmonary disease, choking, asphyxia, hypoglycaemia, children necrosis, proliferative angiopathy e.g. diabetic microangiopathy with necvascularisation. Suppressing an immune response is useful for with necvascularisation of an autoimmune disease such as systemic lupus crythematosus, multiple sclerosis, insulin dependent diabetes mellitus, syndrome, scleroderma, polymyositis, chronic active hepatitis, anaemia, autoimmune thyroiditis, idiopathic Addison's disease, vitiligo, gluten-sensitive enteropathy, autoimmune neutropenia, myaschenia gravis, idiopathic thrombocytopenia purpura, Grave's disease, ovitiligo, gluten-sensitive enteropathy, autoimmune neutropenia, myaschenia gravis, idiopathic proliferative and oncoganic disease which includes sarcomas and carcinomas e.g., bladder carcinoma, colon carcinoma, chronic leukaemia, fibrosarcoma, liposarcoma, degenerative discorders, growth deficiency, hypoproliferative discorders, phypical trauma, lesions and wounds. The method is also used in gene therapy. The present sequence is human Stat3

The compound is used for treating an animal having a disease or condition associated with dual specific phosphatase 5 such as a hyperproliferative disorder, a developmental disorder, an inflammatory disorder or a disease which arises from aberrant apoptosis. Sequences ABX09062-ABX09139 represent human dual specific phosphatase 5 phosphorothioate oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense modulation of dual specific phosphatase 5 expression used in treating disorders e.g. inflammatory diseases.
                                                                                                                                                                                                                                                                                      Human; dual specific phosphatase 5; 8s; developmental disorder;

Given in ABR43625 to ABR43633. CLASP sequences have immunosuppressive, antiinflammatory, antiinheumatic, antiarthritic, dermacrological and nathifammatory, antiinheumatic, antiarthritic, dermacrological and nephrotropic activities. Compositions comprising a CLASP-1 protein can be used for treating or preventing a CLASP-1 mediated disease, particularly an autoimmune disease caused or exacerbated by increased activity of TH1 (helper T) cells. CLASP polymuchocitides can be used as probes or primers for detecting CLASP expression, for screening CLASP agonists or antagonists, for creating transgenic animals, chromosome mapping, antagonists, for maintute biological samples, polymorphic markers for forensic analysis, and as reagents for paternity testing. CLASP polymuchocides or polypeptides are useful in treating or preventing autoimmune diseases (e.g. Addison's disease, rheumatoid arthritis, or dermatitis), organ rejection or graft-versus-host diseases, inflammation (e.g. sepsis, arthritis or nephritis), or infectious diseases. Accessed to ACC65727 and ABR43642 represent sequences given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New cadhesin-like asymmetry protein (CLASP) polypeptides and polynucleotides, useful for treating or preventing autoimmune diseases, organ rejection or graft-versus-host disease, inflammation, or infectious
                                                                             cadherin-like asymmetry protein; immune response; immunosuppressive; antiinflammatory; antirheumatic; antiarthritic; dermatological; nephrotropic; autoimmune disease; Addison's disease; dermatilis; rheumatoid arthritis; organ rejection; graft-versus-host disease; inflammation; sepsis; arthritis; nephritis; infectious disease;

New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding HKR1, useful for treating a disease/condition associated with HKR1, such as hyperproliferative disorder, e.g. lung, brain or breast cancer.

Example 15; Page 72; 105pp; English.

targeted to, and which specifically hybridises with a nucleic acid described. (1) a compound 8-50 nucleobases in length that specifically hybridises with at least an 8-nucleobase portion of an active site on nucleic acid molecule encoding HKR1, (2) a composition comprising the compound and a carrier or diluent; (3) a method for inhibiting the expression of HKR1 in cells or tissues by contacting the conjound so that expression of HKR1 is inhibited; and (4) a method of treating an animal having a disease or condition associated with HKR1 by administering to the animal a therapeutic or prophylactic amount of the compound so that expression of HKR1 is inhibited. HKR1 amount of the compound so that expression of HKR1 is inhibited. HKR1 antisense oligonucleotides have cytostatic activities and can be used as HKR1 inhibitors. The compound, composition and methods are useful for treating a disease or condition associated with HKR1, such as a hyperproliferative disorder, e.g. lung, brain or breast cancer, by inhibiting the expression of HKR1. They are also useful in research and diagnostics for modulating the expression of HKR1. The present sequence represents a human HKR1 chimeric phosphorothioate oligonucleotide having 2'-O-methoxyethyl (2'-MOE) wings and a deoxy gap, which is an antisense oligonucleotide used in the inhibition of human HKR1 in an example from The present invention describes a compound 8-50 nucleobases in length the present invention

The present invention describes a compound (I) that is 8-50 nucleobases in length: (a) targets a nucleic acid molecule encoding major histocompatibility complex (MHC) class II transactivator, and specifically hybridises with the nucleic acid encoding the MHC class II transactivator, or (b) specifically hybridises with the nucleic acid encoding the MHC class II transactivator, or (b) specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding MHC class II transactivator. (I) has immunosuppressive, antimicrobial, antidabetic, antirheumatic, antiarthritic, cycostatic, notropic, neuroprotective and immunostimulant activities, and can be used as an MHC class II transactivator inhibitor. The MHC class II transactivator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating MHC class II transactivator gene expression, particularly useful for treating autoimmune disorders such as transplant rejection, Alzheimer's disease, or multiple sclerosis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method of determining whether an individual is predisposed to susceptibility to low bone mineral density (BMD) and/or bone damage comprising identifying whether the individual has at least one polymorphism in a polymucleotide encoding a protein, where the polymucleotide is one of 81 200-500 nucleotide sequences (S1, see ADC98235 to ADC98135). An agent identified in an method from the present invention which can be used for the prevention or treatment of a disease resulting in susceptibility to low BMD and/or bone damage is useful in the manufacture of a medicament for use in modulating the susceptibility to low BMD and/or bone damage is one damage is osteopotosis. The disease associated with low BMD and/or bone damage is osteopotosis. The present PCR primer sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               to low
               disease or condition associated with MHC class II transactivator, e.g. autoimmune disorder or infection. The antisense oligomucleotides can be used for inhibiting the expression of MHC class II transactivator in cells or tissues. In particular, these diseases include transplant rejection, diabetes, rheumatoid arthritis, cancer, Alzheimer's disease, multiple sclerosis, or severe combined immunodeficiency disease. The antisense compounds are useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents a human MHC class II transactivator chimeric phosphorothioate antisense
                                                                                                                                                                                                         oligonucleotide, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   low bone mineral density; BMD; bone damage; polymorphism; osteoporosis; single nucleotide polymorphism; SNP; PCR primer; ss; human.

The invention relates to a novel isolated NOVX polypeptide. The polypeptide of the invention demonstrates, antidiabetic, ancretic, acardiant, hypotensive, antiarteriosclerotic, virucide, antiparterial, tungicide, protozoacide, notropic, neuroprotective, antiparkinsonian, anticorvulsant, osteopathic, antiarthritic, antiinflammatory fungicide, protozoacide, molecules and antilofammatory. The dermatological, nucleic acid antilopaemic activities. The losy peptides, nucleic acid antilopaemic activities. The losy peptides, nucleic acid antibodies and antibodies may be useful for treating or diagnosing diseases including metabolic disorders such as diabetes and obseity, infectious diseases, anorexia, cancer, cardiovascular diseases including hypertension and atherosclerosis, neurodegenerative disorders such as Alzheimer's disease, Parkinson's disease and epilepsy, immune disorders e.g. osteoarthritis, haemopoietic disorders, inflammatory skin disorders, e.g. osteoarthritis, haemopoietic disorders, and polypeptides may also be used to differentiation and proliferation, hemopoiesis, wound healing and angiogenesis, as well as in gene therapy. Finally, the nucleic acids may conventive medicine and pharmacogenomics. The current sequence is that of the RT-PCR primer which was used within the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.
New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                           ö
                                 The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nucleotide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SNPs existing in human genes and for the diagnosis of human disease. The present DNA sequence represents a human gene PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating ailments associated with impaired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   first active agent comprising an oligomuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 muclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory; antiallergic; antiinflammatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;

The invention describes a method of determining the ethnic origin of a male comprising obtaining a nucleic acid sample from the male, and dentifying at least two polymorphic markers in the nucleic acid sample indicative of the ethnic origin of the male, using at least one primer pair given in the specification. Also described is a method of: identifying polymorphic sites in a nucleic acid, a kit for determining the ethnic origin of an individual; determining the ethnic origin of an indoiridual; an isolated nucleic acid segment of origin of a human male individual; an isolated nucleic acid segment of a human y chromosome comprising at least 10 contiguous bases including at least one of the polymorphic sites given in the specification; and determining the paternity of a human male conditional. The method is useful for determining the ethnic origin of a nucleic individual. The method is useful for determining the ethnic origin of a male, for paternity testing, for forensic studies or for diagnosis. This sequence represents a primer used to detect polymorphisms in the non-recombining region of the human Y chromosome (NRY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                               receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Determining the ethnic origin of a male by obtaining a nucleic acid sample from the male and identifying at least two polymorphic markers in the nucleic acid sample indicative of the ethnic origin of the male.
to adenosine, reducing levels of adenosine

The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate contrainers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrentaric agonist; respiratory disease; pulmonary vasconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;

The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel composition (a) a first active agent,
                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tο
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antisense; bronchoconstriction; allergy; hyposecretion; pain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      respiratory tract inflammation, adenosine sensitivity, lung, cancer, surfactant depletion, antiallergic, antiinflammatory, antiasthmatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted toucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ä

ó
           with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc. tissue environment and thereby, to
inflammation, allergies and/or surfactant hypoproduction are associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SMRT inhibitor; cytostatic; antiinflammatory; antiarthritic;

the present invertion describes a compound (1) acounticeobases in the present invertion describes a compound (1) specifically hybridises with the nucleic acid molecule encoding SNRT and inhibits expression of with the nucleic acid molecule encoding SNRT and inhibits expression of SNRT. (1) specifically hybridises with at least 8-nucleobase portion of a preferred target region on nucleic acid molecule encoding SNRT. Also described is a composition (II) comprising (I) and a carrier or diluent. (I) and (II) have cytostatic, antiinflammatory, antiarthritic and antichemmatic activities, and can be used in antisense therapy, and as SNRT expression inhibitors. (I) is useful for inhibiting the expression of SNRT in cells or tissues. (I) is also useful for treating an animal having a disease or condition associated with SNRT, e.g., inflammatory disorder such as rheumatoid arthritis; or a hyperproliferative disorder such as rheumatoid arthritis; or a hyperproliferative disorder expression of SNRT. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence companies of the present contains the present sequence is designated as SEQ ID NO.30 in chambiour. (I) the present sequence is designated as SEQ ID NO.30 in example 15 but corresponds to SEQ ID NO.32 in the Sequence Listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                               The present invention describes a compound (I) 8-50 nucleobases in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antisense compound targeted to nucleic acid encoding SMRT (silencing mediator for retinoid and thyroid hormone action), useful for
(silencing mediator for retinoid and thyroid hormone action), useful for treating animal having disease associated with SMRT such as cancer, rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SMRT; silencing mediator for retinoid and thyroid hormone action; SMRT inhibitor; cycostatic; antiinflammatory; antiarthritic; antirheumatic; antisense therapy; inflammatory disorder; rheumatoid arthritis; hyperproliferative disorder; cancer; leukaemia; breast cancer; human; ss; target.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

transported to a nucleic acid molecule encoding SMRT (silencing mediator for retinoid and thyroid hormone action), where (1) specifically hybridises with the nucleic acid molecule encoding SMRT and inhibits expression of SMRT. (1) specifically hybridises with at least 8-nucleobase portion of a preferred target region on nucleic acid molecule encoding SMRT. Also described is a composition (11) comprising (1) and acarrier or diluent. (1) and (11) have cytostatic, antidflammatory, antiarthritic and antirheumatic activities, and can be used in antisense therapy, and as SMRT in cells or tissues. (1) is useful for training the expression of SMRT in cells or tissues. (1) is useful for training the expression of SMRT in cells or condition associated with SMRT, e.g., inflammatory disorder such as rheumatoid arthritis; or a hyperproliferative disorder such as rheumatoid arthritis; or a hyperproliferative disorder such as rheumatoid arthritis; or a hyperproliferative disorder corphylaxis and as research reagents and breast cancer, by inhibiting the expression of SMRT target region sequence. The present sequence represents a human SMRT target region sequence; which is used in an example from the present invention. N.B. The present sequence is example from the present invention. N.B. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ·,
                                                                                                   The present invention describes a compound (I) 8-50 nucleobases in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "OTHER= Phosphorothioate backbone. All cytidines
are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /mod_base= OTHER

                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                          The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclindependent kinase 4, specifically hybridises with the nucleic acid encoding cyclin-dependent kinase 4 and inhibits expression of cyclindependent kinase 4. The antisense oligonucleotide is useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer. This sequence represents a human cyclin dependent kinase 4 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /mod_base= OTHER

                                                                                                                                                                                                                            The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= b/mod_base= OTHER

                                                                                                                                                                                                               ö
                                                                                     The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.

The present invention describes a compound (1) of 8-80 nucleobases in length targeted to a nucleic acid molecule encoding polo-like kinase, where (1) specifically hybridises with at least an 8-nucleobase portion of a polo-like kinase, or specifically hybridises with at least an 8-nucleobase portion of a preferred target region on a nucleic acid molecule encoding polo-like preferred target region on a nucleic acid molecule encoding polo-like preferred target region on anucleic acid molecule encoding polo-like compression of polo-like kinase. Also described: (1) a composition comprising (1) and a pharmaceutical carrier or diluent; (2) inhibiting the expression of polo-like kinase in cells or tissues comprising contacting the cells or tissues with (1); (3) treating an animal having a disease or condition associated with polo-like kinase comprising administering to the animal a therapeutic or prophylactic amount of (1) so that expression of polo-like comprising contacting a preferred target region of a nucleic acid molecule encoding polo-like kinase with one or more candidate antisense compounds comprising at least an 8-nucleobase portion which is compounds comprising at least an 8-nucleobase portion which is compounds comprising at least an 8-nucleobase portion which is compounds comprising an entisense compounds which inhibits the expression of antisense compounds (1) can be used for inhibits the expression of antisense or compounds (1) can be used for inhibiting the associated with aberrant expression of polo-like kinase, e.g. hyperproliferative disorder such as cancer, including non-small cell lung cancer or coephageal cancer. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tunnour formation: The present sequence represents a human polo-like kinase chimeric phosphorochioate antisense oligonucleotide, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
New antisense compounds targeted to nucleic acid molecules encoding pololike kinase, useful for treating diseases associated with aberrant expression of polo-like kinase, e.g. non-small cell lung cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polo-like kinase; polo-like kinase inhibitor; antisense oligonucleotide; cycostatic; antisense gene therapy; kinase inhibitor; hyperproliferative disorder; cancer; hyperproliferative non-small cell lung cancer; oseophageal cancer; infection; inflammation;

                                                                                                                                                                                                                                                                                              The present invention describes a compound (I) of 8-80 mucleobases in clearly transfer acid molecule encoding polo-like kinase, where (I) specifically hybridises with nucleic acid molecule encoding polo-like kinase, or specifically hybridises with at least an 8-nucleobase portion of a preferred target region on a nucleic acid molecule encoding polo-like kinase and inhibits the expression of polo-like kinase in calls or tissues comprising comparising polo-like kinase in calls or tissues comprising administering the calls or tissues with (I); (3) treating an animal having a disease or condition tissues with (I); (3) treating an animal having a disease or condition tissues with (I); (3) treating an animal having a disease or condition tissues with (I); (3) treating an animal having a disease or condition comprising contacting a preferred target region of a nucleic acid compounds comprising or prophylactic amount of (I) so that expression of polo-like kinase with one or more candidate antisense compounds which including a nucleic acid molecule encoding polo-like kinase with an acidate antisense compounds which including the expression of antiinflammatory and antimicrobial activities, and can be used in antisense gene therapy, and as kinase inclink kinase. (I) has cytostatic, antiinflammatory and antimicrobial activities, and can be used for inhibiting the coligonucleotides or compounds (I) can be used for inhibiting the concerned with absertant expression of polo-like kinase, and can can ease or conditions associated with absertant expression of polo-like kinase, and can can ease or conditions associated with absertant expression of polo-like kinase, and can can oscophageal cancer. The antisense compounds are also useful a research reagents and kits, or in disgonetic, therapeutic and can can be used for inhibiting the cancer or oscophageal cancer. The antisense compounds in a meaning of polo-like kinase target oligonucleotide, which is research reagents and which as cancer to resophageal cancer. The present sequenc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                   New antisense compounds targeted to nucleic acid molecules encoding pololike kinase, useful for treating diseases associated with aberrant expression of polo-like kinase, e.g. non-small cell lung cancer or

This invention relates to a novel DNA molecule which comprises a DNA molecule made up of the following elements in a 5' to 3' direction: a first restriction endomuclease site; a T3 promoter site; at least one Tag gene comprising at least 5 20mer Tag sequences; a poly A site having at least 21 consecutive A residues, a second restriction endomuclease site which may be the same or different than the first restriction endomuclease site promoter. The invention may be useful in nucleic acid analysis, in particular to synthetic Tag genes useful as assay controls, in assay development, product development and validation and for quality control. The present sequence is that of a Tag oligonucleotide probe which may be used during the creation of the novel DNA molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                               New DNA molecules made by annealing and extending overlapping 60mer oligonuclectides, useful in producing synthetic Tag genes useful as assay controls, in assay development, product development and for quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                         The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                Novel polynucleotide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                                                                                                                                                                                                                                                Gaps

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants threeof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of active site on the nucleic acid molecule encoding LRH1 (also known as NRSA2). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothioate linkage; at least one modified sugar moiety, a 2'-O-methoxyethy1 (2' NDE) and at least one modified nucleobase, a 5-methylcytidine. These antisense compounds are useful for treating or diagnosing a disease associated with LRH1, such as breast cancer, dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high
                                                                                                                                   human; ss; liver related homologue-1; LKH1; NR5A2; antisense; phosphorothicate; 2' MOE; breast cancer; dyslipidaemia; atherosclerosis; low HDL; high density lipoprotein; high LDL; hypercholesterolaemia; gall stone; triglyceridaemia; obesity; heparitis; heparcocliular carcinoma; aromatase; cytostatic; antilipaemic; antiarteriosclerotic; anorectic; heparotropic; litholytic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (2' MOE) nucleotides. All
ses are 5-methylcytidine."
       triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit cytostatic, antilipaemic, antiarrisoclarotic, anorectic, hepatotropic, litholytic, antilnflammatory and virucidal activities. This oligonucleotide sequence is an antisense DNA oligo used to modulate the expression of the human LRH1 protein of the invention.

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LAH1) and splice variants the expression of liver related homologue-1 (LAH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in the related bording LAH1 (also known as NREAD). LEMH1 is a monomeric orphan molear receptor protein that functions as a tissue specific conclement comprise at least one modified internucleoside congonucleotides that comprise at least one modified internucleoside congonucleotides that comprise at least one modified sugar moiety, linkage, a phosphorothioate linkage; at least one modified sugar moiety. Inkage, a phosphorothioate linkage; at least one modified sugar moiety. Inkage. These antisense compounds are useful for treating or emplycytidian af isease associated with LRH1, such as breast cancer, displicamia, atherosclerosis, low HDL (high density lipoprotein), hypercholesterolaemia, gall stones, consition, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit conficuents and antistense compositions exhibit conficuents an antistense bus observed the invention.

Cytoscatic, antilipaemic, antiatreriosclerocic, anorectic, hepatotropic, cytoscatic, antilipaemic, antistense bus observed to modulate the oligonucleotide sequence is an antisense bus oligo used to modulate the cytoscaticn of the human LRH1 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /mod_base= OTHER /nethoxyethyl (2' MOE) nucleotides. All cytidine nucleobases are 5-methylcytidine."

This invention relates to novel antisense compounds useful for modulating the expression of liver related hamcloque-1 (LRHI) and splice variants of thereof. Specifically, it refers to compositions 8-30 mucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRHI (also known as NEA2). LRHI is a monomeric orphan cranscription factor. The present invention describes antisense curscription factor. The present invention describes antisense configuration factor. The present invention describes antisense coligonucleotides that comprise at least one modified internucleoside inkage, a phosphorothioate linkage; at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MOE) and at least one modified sugar moiety, methylcytidine. These antisense compounds are useful for treating or diagnosing a disease associated with LRHI, such as breast cancer, cyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), hyperoblesterolaemia, gall stones, cyfslipidaemia, obesity, hepaticles virus-mediated acute or chronic cytostatic, antilipaemic, antilatreriosclerotic, ancectic, hepatotropic, cytostatic, antilipaemic, antilatreriosclerotic, ancectic, hepatotropic, coligonucleotide sequence is an antisense DNA oligo used to modulate the vary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 20 BP; 4 A; 1 C; 9 G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human NOVX polypeptides and the polymucleotides are useful for encoding them. The NOVX polypeptides and polymucleotides are useful for determining the presence of or predisposition to a disease associated determining the presence of or predisposition to a disease associated with altered levels of the sequences in a mammalian subject, and for treating or preventing a pathology associated with NOVX. The propertides, polymucleotides and antibodies that bind immunospecifically cto the polypeptides are useful for treating or preventing disorders or to the polypeptides are useful for treating or preventing disorders or syndromes such as compenital heart defects, cardiomyopathy.

CC syndromes such as compenital heart defects, cardiomyopathy, atheroscierosis, hypertension, pulmonary stenosis, soleroderma, compendence denocarcinoma, haemophilia, graft-versus-host disease, cancer, adenocarcinoma, haemophilia, graft-versus-host disease, ascherosis, diabetes, obesity, bronchial asthma, acquired multiple sclerosis, diabetes, obesity, bronchial asthma, acquired norexia and immune disorders. This sequence represents a PCR primer used to amplify a human NOVX polymucleotide of the invention. Note: The sequence date for this patent is also available from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; notropic; antiarthitic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation;

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The thuman microsomal prostaglandin E2 synthase (mpGES-1). The thuman microsomal prostaglandin also describes: (1) antisense compounds, 9434.3. The present invention also describes: (1) antisense compounds, compass-1, which specifically hybridise with the nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding compass-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of inhibits its expression; (2) a method of inhibiting the antimal cross of antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antishamatory, neuroprotective, nootropic, antiarthritic, vasotropic, antiinflammatory, neuroprotective, nootropic, antiarthritie, and can ophthalmological, immunomodulatory and cardiovascular activities, and can condition associated with mpGES-1 e.g., inflammation, Altheimer's condition associated with mpGES-1 e.g., inflammation, Altheimer's condition associated with mpGES-1 e.g., inflammation, altheimer's cohthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g. inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                /note= "phosphorothioate linkages and all cytidine residues are 5-methylcytidines"

Human HIP1 antisense oligonucleotide ISIS251585.

```
The invention relates to an isolated, mutant murine or human phospholipase C (PLC) gamma-2 protein. The mutant PLCgamma-2 proteins and nucleic acids that encode them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate PLCgamma-2 treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of PLCgamma-2 by expressing inactive proteins or to supplement the patients administered to down regulate PLCgamma-2 expression. The PLCgamma-2 administered to down regulate PLCgamma-2 expression. The PLCgamma-2 modulators of PLCgamma-2 expression and activity. The antibodies and modulators of PLCgamma-2 expression and activity. The antibodies and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mutant muirine or human Phospholipase C (PLC) gamma-2 proteins, useful for preventing, diagnosing and treating inflammatory diseases, e.g. Wegener's granulomatosis, Churg-Strauss syndrome or Polyarteritis nodosa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antagonists may also be used to down regulate expression and activity. Disorders that may be prevented, diagnosed and/or treated by the above methods include, e.g. Wegener's granulomatosis, Churg-Strauss syndrome or Polyarteritis nodosa. This sequence corresponds to a PCR primer to amplify the mouse phospholipase C gamma 2 gene.
                                                                                                                                                                                  ss; primer; anti-inflammatory; dermatological; osteopathic; ophthalmological; antiulcer; murine; human; phospholipase C gamma-2 protein; diagnosis; Wegener's granulomatosis; Churg-Strauss syndrome; Polyarteritis nodosa.
                                                                                                                                               Mouse phospholipase C gamma 2 gene amplification primer plcg2-40.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.8%; Score 14.8; DB 1; Length 20;

The invention relates to a compound targeted to a nucleic acid molecule conciding huntingtin interacting protein 1, HIP1. The compound, 8-80 nucleobases in length, is an antisense oligonucleotide, where the compound specifically hybridises with the nucleic acid molecule encoding compound specifically hybridises with the nucleic acid molecule encoding huntingtin interacting protein 1 comprising a sequence appearing as a NNO1766 and inhibits the expression of huntingtin interacting protein 1. The expression of huntingtin interacting protein 1, a diagnostic method for identifying a disease of contracting protein 1, a diagnostic method for identifying a disease of animal having a disease or condition associated with huntingtin conteracting protein 1 compound so that expression of huntingtin interacting protein 1 is inhibited. The compound and the methods are useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis e.g. Huntington's disease. The HIPI continents on the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New compound that modulates huntingtin interacting protein 1 expression, useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                              huntingth interacting protein 1 comprising a sequence appearing as huntingth interacting protein 1 comprising a sequence appearing as huntingth interacting protein 1.

Also included are inhibiting the expression of huntingth interacting protein 1.

Also included are inhibiting the expression of huntingth interacting protein 1 in cells as a same of manifold of a modulator of huntingtin interacting protein 1, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with huntingtin interacting protein 1 compound so that expression of huntingtin interacting protein 1 is inhibited. The compound and the methods are useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis e.g. Huntington's disease. The HIPI dysregulation charged region from the HIPI cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a compound targeted to a nucleic acid molecule encoding huntingtin interacting protein 1, HIPL The compound, 8-80 nucleobases in length, is an antisense oligonucleotide, where the compound specifically hybridises with the nucleic acid molecule encoding
                                                                                                                                                                                                                                                                                                                                           New compound that modulates huntingtin interacting protein 1 expression, useful in treating an animal having a disease or condition involving dysregulation of cellular apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to diagnosing or monitoring transplant crejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The comprises detecting the expression level of one or monitoring methods, system and kits are useful in diagnosing or monitoring creation rejection, e.g. heart, kidney, liver, pancreas, pancreatic ransplant rejection, or mechanical organ replacement rejection, in an experimental rejection or mechanical organ replacement rejection, in an individual. The method is also useful in diagnosing and monitoring an individual. The methods are also useful in diagnosing and monitoring contain, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmume disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.

AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human closed in AAX10269-X1293). These primers can be used in action of electricity that is a primers can be used in action of a territy testing polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia diabetes insipidus, lesch-Nyhan syndrome, muscular hypercholesterolemia, polycystic kidney disease, familial spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary syndrome, osteogenesis imperfecta, acute intermittent porphyria, cutoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such candurance, fertility, and susceptibility or receptivity to particular cutoim to a solonger can also be used to produce medicaments for the treatment or ronnhulaxia of annih Aiseases
                                                                                                                                                                                                                                           New isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease.

Detection of cancer cells in tissue samples - by changes in mRNA expression compared to normal tissue of specific cancer-associated gene

Disclosure; Page 71; 92pp; Japanese.

The primers AAV43732-V43776 were to produce cancer associated gene fragments which can be used to detect cancer cells in tissue samples or biological fluids. They are detected by monitoring the change in mRNA expression as compared to normal tissue of one or more cancer-associated genes whose cDNA stringently hybridises to the nucleic acid fragments. The change in expression may be an increase or a decrease compared to normal tissue. The mRNA expression may be determined by PCR, Northern in the amount of protection assay, or by determining the change tissue, for example by using a labelled antibody recognising the protein. Detection of cancer cells for cancer diagnosis, including detection of metastatic cancer cells in tissues other than the primary tumour site

Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.

Disclosure, Fig 7; 605pp, English

```
This invention describes a novel method for identifying an inhibitor of potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is cused for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor calls of the patient are heterozygous for the first gene, the inhibitor calls of the patient are heterozygous for the first gene, the inhibitor of sactive on at least one but less than all allelic forms of the gene or present in a population and targets only one allelic forms present in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosalerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometricoiss, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone matrow transplants AAZ2S812 represent

         used for preventing the development of cancer in a patient having a used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the present in a population and targets only one allelic form present in the used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New mouse Lpin1 and human LPIN1 genes associated with adiposity/insulin response regulation, useful for screening agents that alter adipose tissue development, or for diagnosing a predilection to lipodystrophy,
                                                                                                                                                                                                                                  malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention

The invention relates to mouse Lpinl and human LPIN1 nucleic acids (ADG27386-ADG27387) and the proteins they encode (ADG27361-ADG27363). The Lpin1/LPIN1 gene encodes a novel nuclear protein called lipin 1, which is highly expressed in adipocytes and plays a key role in adipocyte maturation and metabolism. In mice, mutations in the Lpin1 gene are responsible for the fatty liver dystrophy phenotype (fld) which exhibits characteristics of human lipodystrophy. Lipin 1 proteins, and the related

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is

Composition for treating progressive renal fibrosis comprises non-peptide chemokine CCR1 receptor antagonist, especially arylmethylpiperazine derivative.

Example 6; Page 23; 43pp; English.

The invention relates to a composition for treating progressive renal fibrosis in mammals (preferably humans) and involves a non-peptide chemokine CCR1 receptor antagonist. The compositions are useful for treating progressive renal fibrosis in humans and in cats, dogs, cattle, sheep, goats, horses and rabbits. Sequences ABZ76211-245 represent oligonucleotide primers and probes used in an in vivo assay of chemokine receptor and collagen I mRNA expression

This invention relates to novel isolated nucleic acid molecules, and encoded proteins thereof, for epothilone B hydroxylase (ebh).

Specifically, it refers to recombinant microcorganisms expressing ebh, mutants and/ or ferredoxin, which are capable of hydroxylating small corganic molecule compounds i.e. epothilone. Epothilones are macrolide compounds produced by Sorangium cellulosum, which have been shown to exert microtubule stabilising effects similar to paclitaxel such that they have cytotoxic activity against rapidly proliferating cells. Accordingly, they are natural anticancer agents with neuroprotective, virucidal, antinflammatory and osteopathic activities. The present invention describes epothilones and analogues thereof as useful for treating cancers, inhibiting angiogenesis and treating blindness related to retinal vascularisation. Furthermore, they can be used for conditions including aplastic anaemia, restenosis, Alzheimer's disease, systemic luques erythmatosis and AIDS. This oligonucleotide sequence (SeqID II) is derived from a bacterial cytochrome P450 gene (locus STMSUACB) and used to design PCR primers P450-2- for the amplification of genomic epothilone B hydroxylase DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 eph
